## SUMMARY

---

I'm Noah, a product-focussed engineer on a mission to meet users' needs — whether they be an internal team or a customer. You'll find me happiest in a role which lets me engage with users, participate actively in the product process, and solve plenty of challenging technical problems.

I currently lead a team building products in the workload identity space (an emerging field that's captured my heart), and over the past few years I've worked as a backend engineer and SRE at a variety of startups.

## EXPERIENCE

---

### Teleport | Machine & Workload Identity Lead

May 2022 – Present

Teleport is an open-source platform providing secure, easy zero-trust access to infrastructure. I own the direction of Machine ID — planning the future of the product and leading its execution — while engaging directly with customers: joining sales calls with prospects, supporting escalated issues, and interviewing customers to guide product direction.

More text

- Achieved strong growth of Machine ID through a careful product process, basing decisions on customer interviews, detailed analytics, and a researched understanding of the product market.
- Built rapport with prospects and customers, resolving their issues and working closely with them to inform the future of Machine ID.
- Participated in a small working group of engineers that identified technical debt and set out new best practices for the codebase.
- Discovered and contributed to fixing several high/critical severity vulnerabilities.
- Delivered blog posts and talks representing myself and Teleport.

*Technologies:* Workload Identity (SPIFFE/WIMSE) · Identity and credentials (PKI/X.509, JWT, WIT, OIDC, OAuth2) · Go · Linux · Kubernetes · gRPC/Protobuf

### SPIFFE | Steering Committee & Maintainer

Oct 2025 – Present

SPIFFE SPIFFE SPIFFE

- Did thing A
- Did thing B

### Krystal | Senior Engineer (Cloud Platform)

Apr 2021 – Apr 2022

Joined to bring Go expertise to a team of strong Ruby engineers branching out to Go as part of their Katapult cloud platform.

- Mentored engineers on idiomatic Go, helping a Ruby-experienced team come up to speed with the language.
- Took responsibility for the Kubernetes PaaS on Katapult, building an operator to provision control-plane components for customer clusters and a CCM for those clusters to integrate with the wider platform.
- Built a bespoke tool for managing the deployment of containerised applications onto Linux hosts where the complexity of Kubernetes was unnecessary.

*Technologies:* Go · Docker · Podman · Containerd · Kubernetes · gRPC

### Cudo Ventures | Senior Engineer (Infrastructure & SRE)

Dec 2020 – Apr 2021

Returned to Cudo to lead on SRE and operations matters, continuing to push for the uptake of Go and microservices using my experience from WalkUp.

*Technologies:* GCP · Kubernetes · Prometheus · Grafana · Chronosphere · Pulumi · Helm · Go · Node.js · MySQL

### WalkUp | Senior Backend Engineer

Jun 2020 – Dec 2020

Owned scaling the backend from 40,000 to over 800,000 customers per week in just three months — scoping out and rectifying reliability and scaling issues in a pre-existing codebase while balancing new feature work. Took on the mentorship of a junior backend engineer as the company grew. Event-driven microservices architecture with a focus on reliability and scalability.

*Technologies:* Go · GCP · Kubernetes · Helm · Prometheus · Grafana · RabbitMQ · Redis · Firestore

## Cudo Ventures | Software Engineer

Aug 2018 – Jun 2020

Joined as a fullstack engineer straight out of college, working on the Node.js API, Electron app and Vue web app. As the team grew my role shifted to backend development and infrastructure — managing Kubernetes clusters, observability tooling and deployment mechanisms — and providing support and mentoring as Cudo ran Go in production for the first time.

*Technologies:* Vue · React · Electron · JavaScript · TypeScript · Go · GCP · Kubernetes · Ansible

## Freelancing & Consulting | Software Engineer

Nov 2016 – Aug 2018

Delivered freelance projects for a variety of clients with a focus on quality solutions that meet the client's needs — generally fullstack web applications — and consulted other developers on scaling and deploying their projects onto cloud platforms.

## TECHNICAL SKILLS

---

**Technical:** Workload Identity (SPIFFE/WIMSE) · Identity and credentials (PKI/X.509, JWT, WIT, OIDC, OAuth2) · Go · Protobuf/gRPC · Linux · Kubernetes · Networking (IP, TCP, TLS and SSH) · Distributed systems · Observability (OpenTelemetry and Prometheus)

**Leadership & Product:** Planning and executing the product and technical aspects of an MVP · Customer interviews, support and product design · Incident response and management · Writing customer-facing documentation · Blog posts and conference talks · Team leadership and mentoring engineers
